AVAILABILITY OF REPRINTS AND PUBLICATIONS

Wildlife Review does not distribute any of the papers abstracted herein, nor can the editor of *Wildlife Review* undertake to obtain copies of these papers for anyone. A reprint of an article published in a journal may be available from the author, from the organization with which the author is affiliated, or from the publisher of the journal in which the article appeared. When an author's address is known, it is shown in square brackets following the citation. Addresses of most wildlife organizations can be obtained from the *Conservation Directory*, an annual publication available from the National Wildlife Federation, 1412 16th Street, N.W., Washington, D.C. 20036, at a price of $4.00 a copy. This directory lists more than 900 agencies and organizations concerned with natural resources use.

Use of funds for printing this publication approved by the Director of the Office of Management and Budget, March 3, 1976.

Camera copy for this issue of *Wildlife Review* has been generated by computer programs developed by the Office of Library and Information Services, U.S. Department of the Interior, Washington, D.C.

[Bureau Land Manage., Tuscaloosa, Ala.] Abstract: Small mammals (primarily rodents) were sampled by a mark-recapture grid study in 4 habitats--two affected by strip mining and two natural communities. Species occurrence, species diversity, and similarity of rodent faunas among the habitats are discussed. Recommendations to improve wildlife habitat on lands reclaimed after lignite mining are offered.

[Dep. Biol., Univ. Pa., Philadelphia 19104] Abstract: The mathematical relationship between species survivorship and duration curves is derived using standard demographic arguments. The result, when applied to the late Cenozoic mammals, suggests that there was an inhomogeneity in the mammalian radiation just before the Wurm, or that the mammalian speciation process has not yet attained the stable-age distribution.

[Western Foundation Vertebr. Zool., 1100 Glendon Ave., Los Angeles, Calif. 90024] Abstract: Thickness indices of eggshells collected before and since use of DDT began were obtained for 31 species and subspecies of American shorebirds. Little change in thickness was found between early and recent samples, the maximum being -4.7 percent in "American" Oystercatcher (/Haematopus ostralegus palliatus/) eggshells from Texas and the Atlantic coast of the United States.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in island territories under U.S. administration.
